

# DATA WAREHOUSE

## Business Intelligence

### High-level tool for decision making.

#### FEATURES

- 1 High-level analysis tool aimed at senior middle management and senior management of the company.
- 2 Designed specifically for development by the client about the necessary analysis tools for its own management.
- 3 Fully integrated with standard office software for numerical analysis: Microsoft excel.
- 4 No specific skills are required to manage spreadsheets.
- 5 Chance to save queries for later update with real-time data.

Can I immediately analyze the results of a business line? And extending this same query to an analysis by customer or route or warehouse in less than five seconds?

And also see it per kilo, per package or any other general scale? Can I also view the analysis by year and month in less than five seconds? And save the query and for each period set to update automatically? The answer to all these questions is YES... with the Data Warehouse module of MYMSOFTERP solution.

It is an analysis tool aimed at senior middle management and senior management of the company, fully integrated with windows office excel solutions, so it is no longer necessary to have advanced knowledge. With this solution specifically designed for the analysis of customer's own management, we will get from Data Warehouse MYMSOFTERP module the widest range of potential "corporate control panel" self-sufficiently and with the chance to save for later updating with data in real time.

These systems must work according to the rules defined as "FASMI" referring to five words: Fast Analysis of Shared Multidimensional Information we mention below.

Fast: the system must be able to respond in a quick and fast way to information requested by the user, which should not wait more than five seconds when solving simple requests and no more than twenty seconds in complex requests. Tools must provide a wide variety of techniques to enforce this rule, such as specialized data storage, pre-computation...

Analysis: means that the system must be able to reflect any business logic to respond to specific questions and business needs. For example, it must allow generating 'ad-hoc' calculations without using a specific programming tool.

Shared: the system should provide tools that ensure data confidentiality, access security for user profiles...

Multidimensional: the tool should provide support to each of the multiple levels that may exist within the organization.

Information: are all the data and information derived from this analysis process, which will allow us to decisions making in our organization.

With this powerful tool is ultimately the user who can decide the control documents are needed, which can modify and finally make the decision of what and how to analyze every moment.
